Format of propose(recommend from Johnny):

1. State your question
2. Talk about what graph that you want to use; roughly talk about what does it gonna be look like
3. How can this graph give us a hypothesis
4. What should be the reader's takeaway info

Junwen Yu:

1. If you have been working on a homework problem for 15 minutes without making any progress, what action are you most likely to take in each of the following scenarios?

| Situation /choice | Trying on my own | Seek help from a classmate or TA | Ask AI for a hint or explanation | Ask AI for the complete solution | Leave the problem as incomplete |
|---|---|---|---|---|---|
| When you have **more than enough time** to finish your assignment before the deadline | | | | | |
| When you have **just enough time** to finish your assignment before the deadline | | | | | |
| When you **don't have enough time** to finish your assignment before the deadline | | | | | |

Stacked bar chart: Shows percentages. Tells how the distribution of students' preferred homework strategies differs depending on the time remaining before a deadline. For example, maybe as deadline pressure increases, the percentage of students who ask AI for a hint or explanation/Ask AI for a complete solution increases.

1. Hypothesis: As deadline pressure increase, the percentage of student that ask AI for hint or explanation/Ask AI for complete solution, increase. (proved through survey)
2. Takeaway: Tell the reader that deadline pressure is associated with different homework-solving preferences. (Key point is to see percentage/amount, not changes)

How often do you use AI in the given example to study

| | I use it very often | I use it sometimes | I use it rarely | I don't use AI for this | Prefer not to answer |
|---|---|---|---|---|---|
| Reviewing Lecture slides | ○ | ○ | ○ | ○ | ○ |
| Doing homework for STEM related subjects (ex. Math or Physics) | ○ | ○ | ○ | ○ | ○ |
| Doing writing based assignments (ex. English or Psychology) | ○ | ○ | ○ | ○ | ○ |
| Reviewing tests to understand how you made a calculation mistake (ex. Math or Physics | ○ | ○ | ○ | ○ | ○ |
| Reviewing written works or tests to understand where you made a mistake or can improve (ex. English or Psychology) | ○ | ○ | ○ | ○ | ○ |
| Asking Questions/Clarifying | ○ | ○ | ○ | ○ | ○ |
| Asking for definitions | ○ | ○ | ○ | ○ | ○ |

Heatmap: shows percentages using different colors. Tells how frequently students use AI for different study activities(reviewing lecture slides, doing HW, etc.). Rows represent study activity; each column represents frequency level(I use it very often, I use it sometimes, etc.)Darker colors represent a higher percentage of students choosing that response. For example, maybe more students use AI very often for asking questions about definitions, while fewer students use it for reviewing lecture slides.

1. Hypothesis: Students are more likely to use AI frequently for asking questions, clarifying concepts, finding definitions, and reviewing mistakes than for completing writing-based assignments or reviewing lecture slides (proved by survey)
2. Takeaway: Tell the reader which study activities students use AI for most often and which activities they use AI for less frequently. The key point is to compare the percentages of different frequency responses across study activaities and identify where AI is most commonly used.(The key point is to see frequency patterns and differences, not changes over time.)

Khant Aung
Parallel coordinate plot

Spider graph (Shiyao Liang)
1. Research questions: In the past 7 days, approximately how many minutes in total did you spend actively using AI tools for schoolwork?
2. Graph: Find the time distribution of student using AI,
